## Preliminary Radio Analysis from an X-Ray/Radio Survey of Nearby Spiral Galaxies Larry A. Maddox, Christopher J. Stockdale, John J. Cowan

Using Chandra and the VLA, we are working to detect and classify many new point sources. Shown in each image are 20cm radio (color) and Chandra source detections (ellipses). While we have few overlaps, those present give us good information about the sources. In the case of M83, we have detected previously unknown supernova remnants as well as a possible X–ray binary.
