

# Front-End amplitude stability

Charles Cunningham and Gie-Han Tan

ALMA Front-End IPT

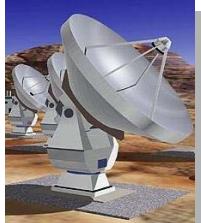

ALMA Project

# ALMA Front-End Technical challenges

Simultaneous requirements:

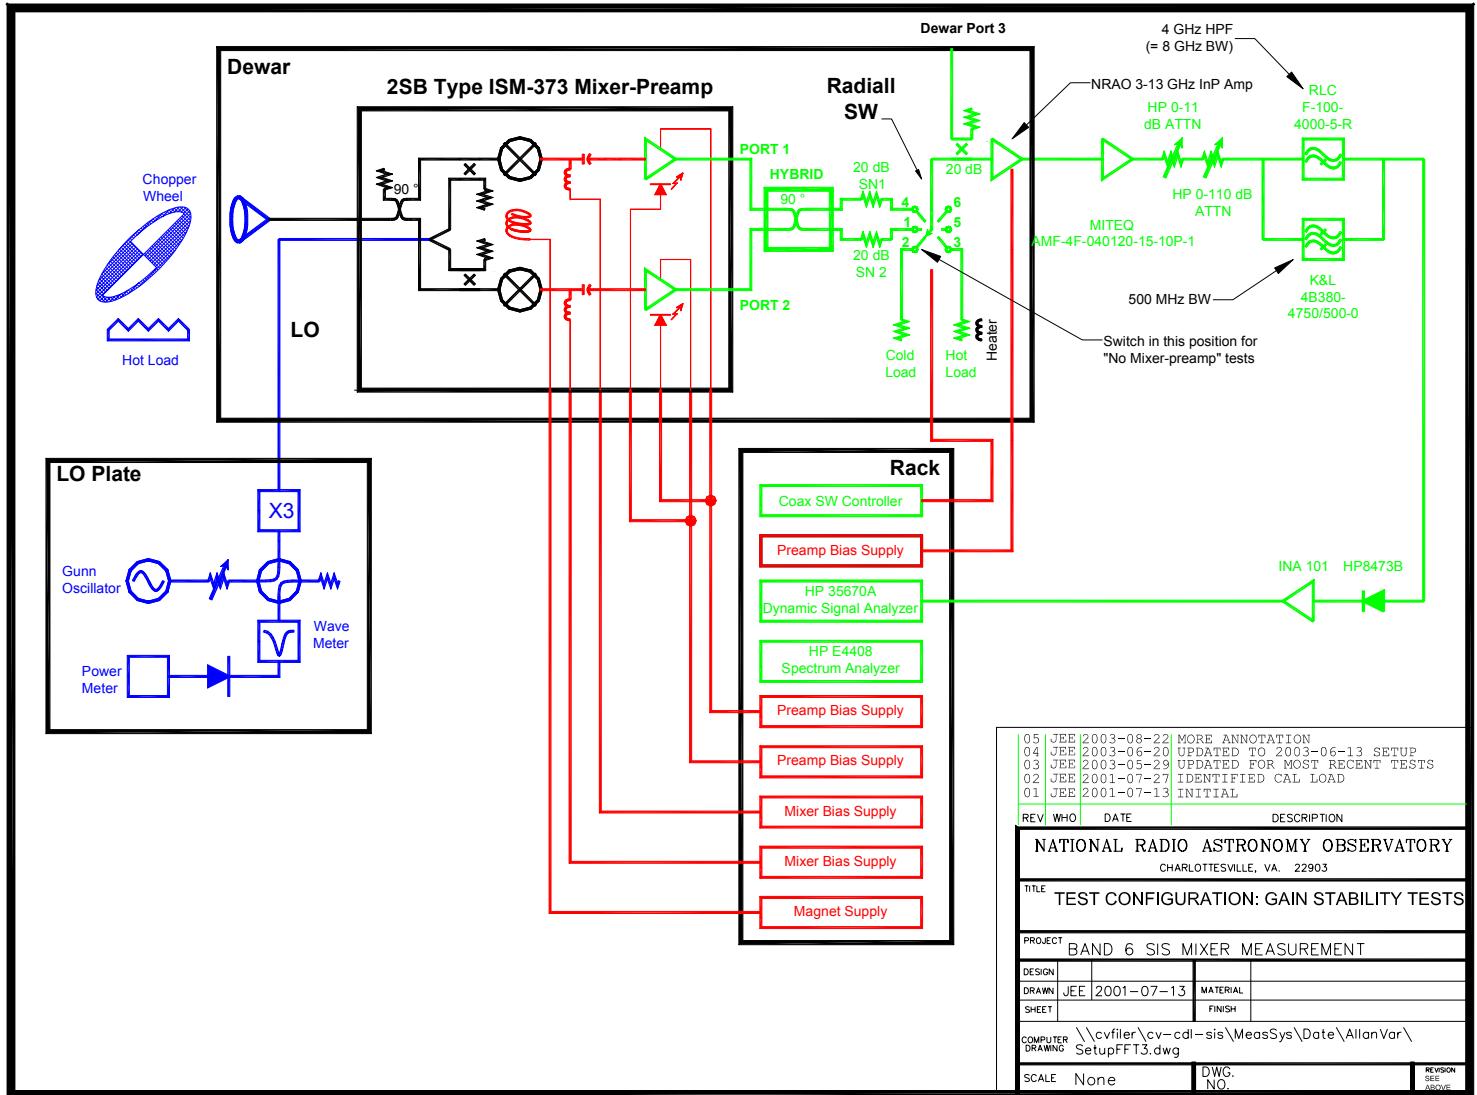

- Wide RF bandwidth - maintaining low noise temperatures
- Wide IF bandwidth with low ripple and slope
- High amplitude and phase stability
- Compact packaging
- No mechanical tuning
- No cryogenic liquids

To date the Front-End IPT have concentrated on demonstrating the basic performance specifications. Recently we have been able to test a representative system for amplitude stability, although a definitive test requires a prototype front-End.

ALMA Project

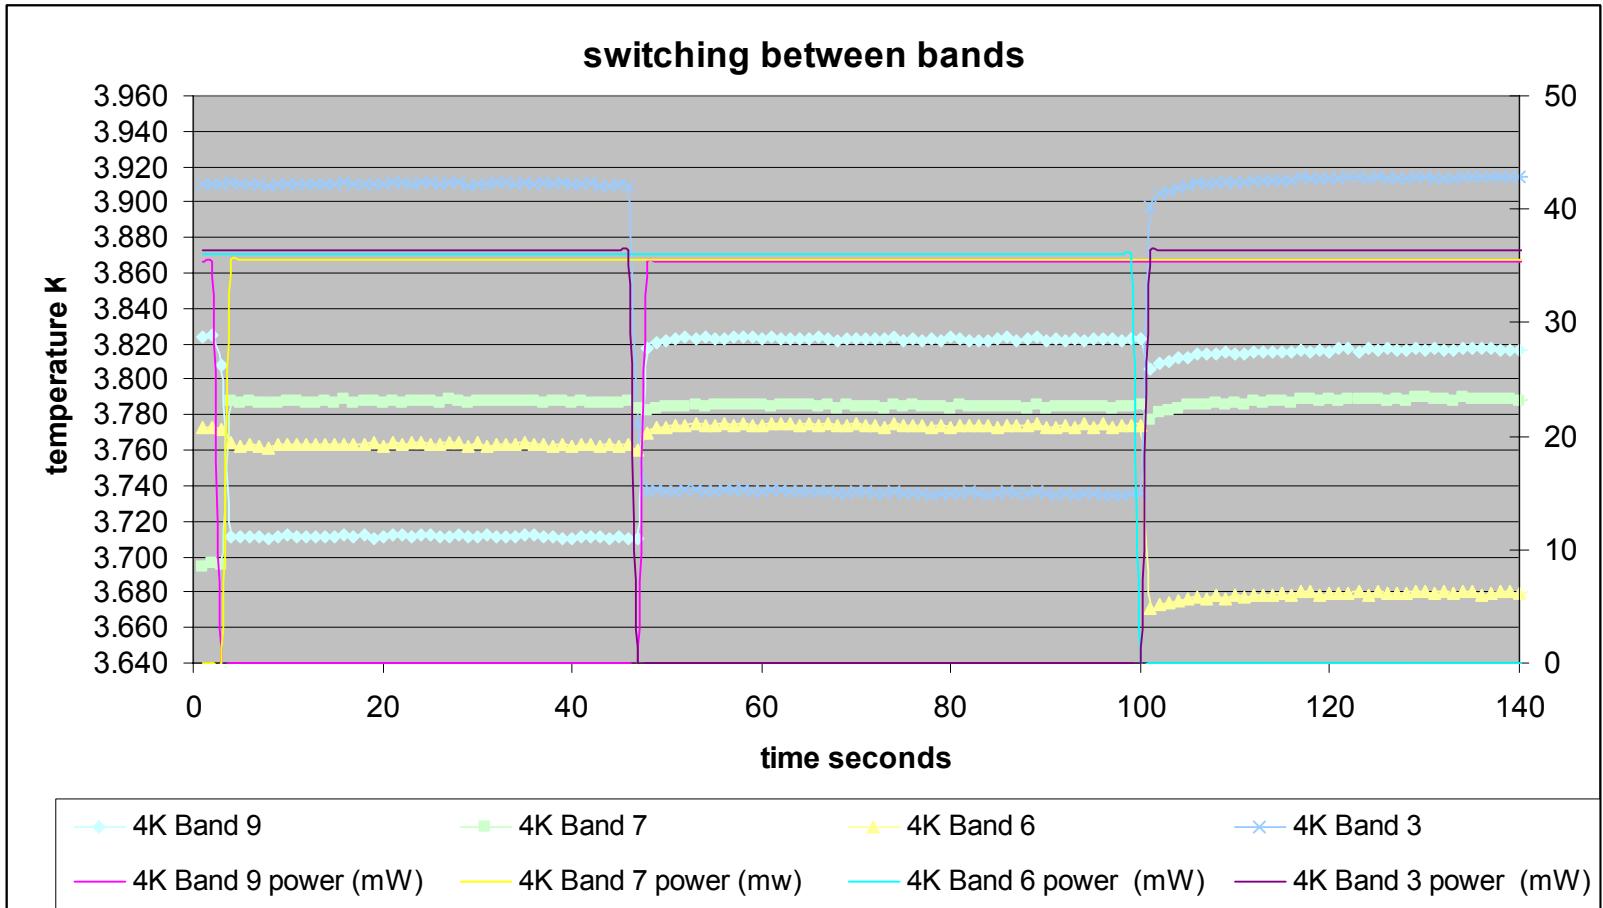

# Experimental set-up

ALMA Project

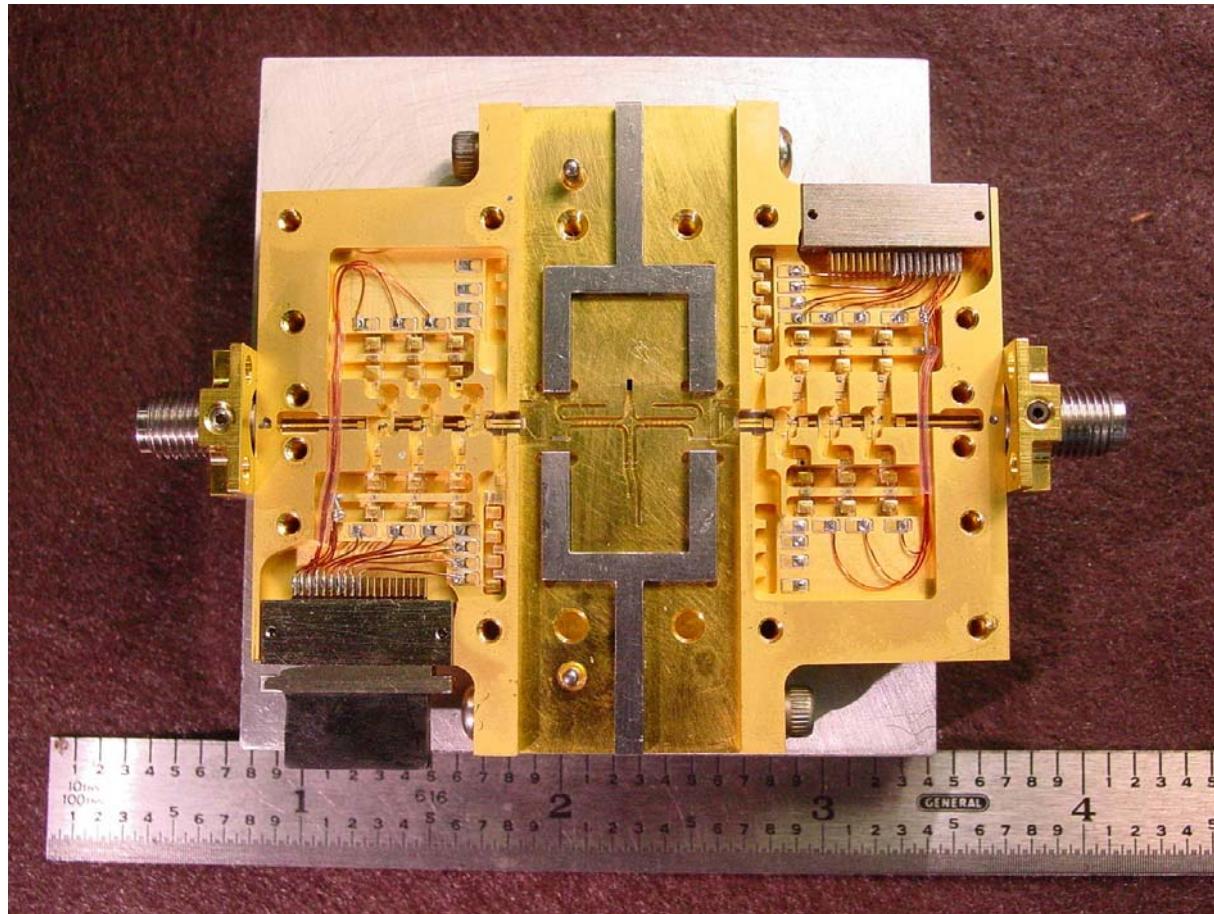

## Cryostat temperature stability

ALMA Project

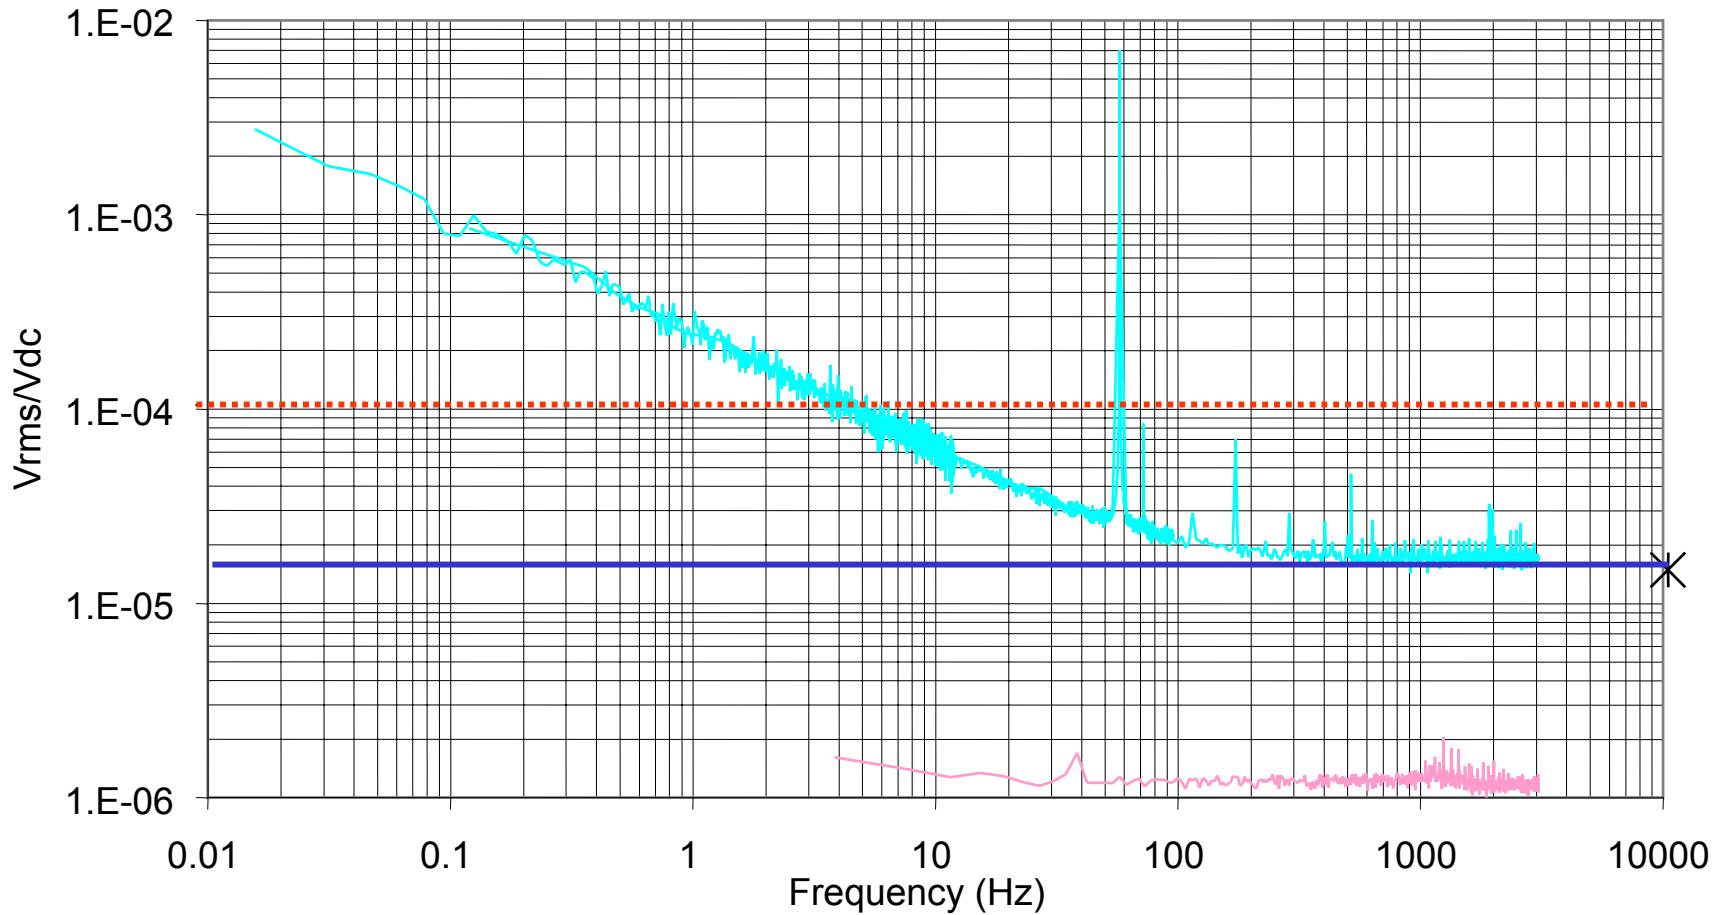

## 2SB Mixer with integrated InP IF amplifiers

ALMA Project

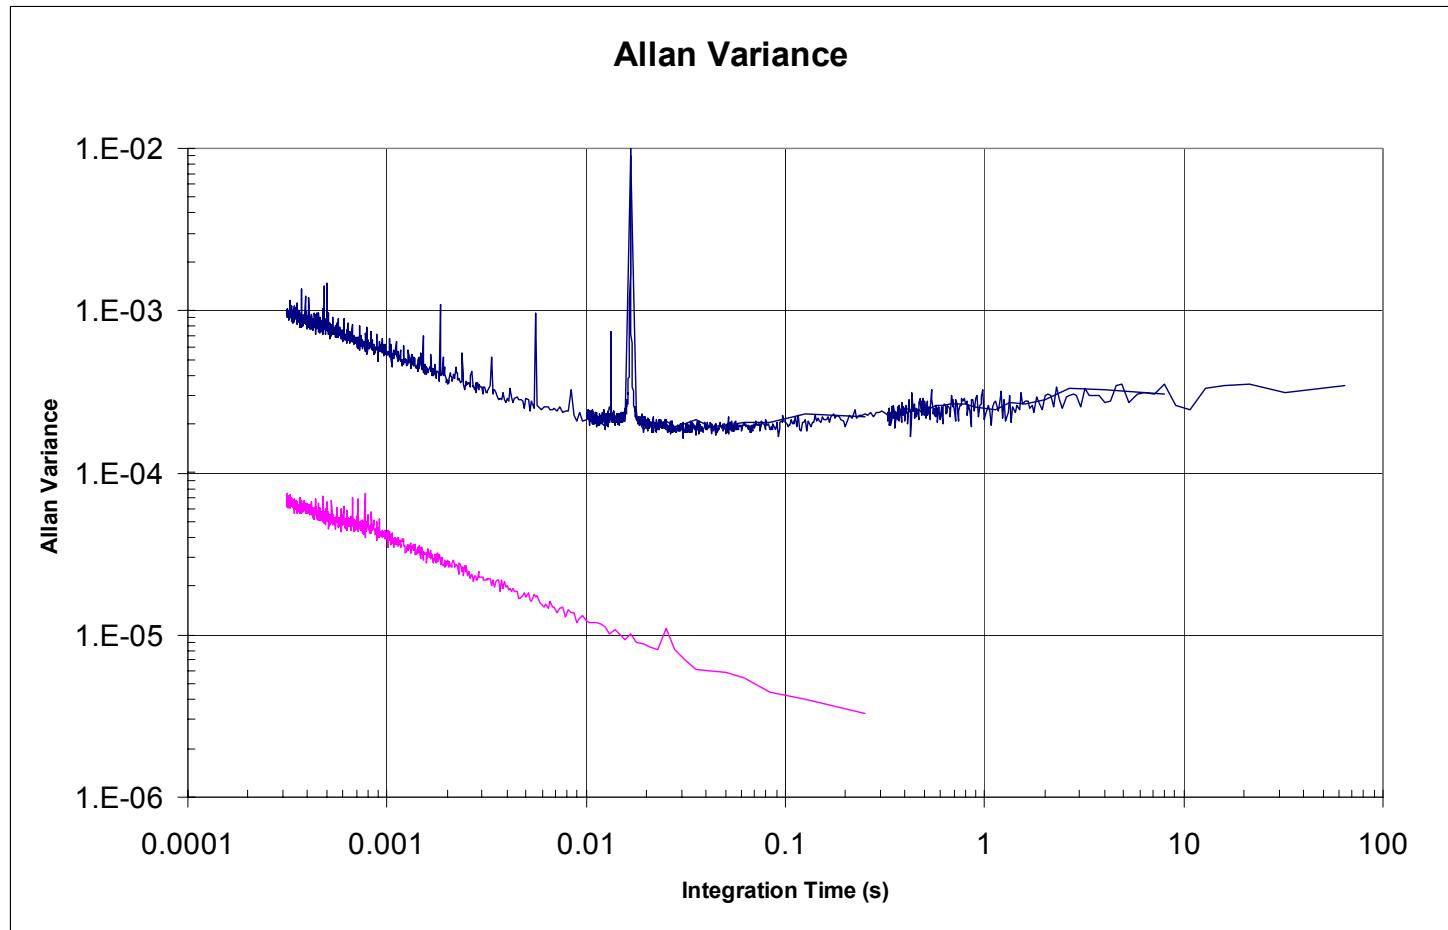

## Power spectral density plot (8 GHz IF BW for no mixer-preamp and analyzer only)

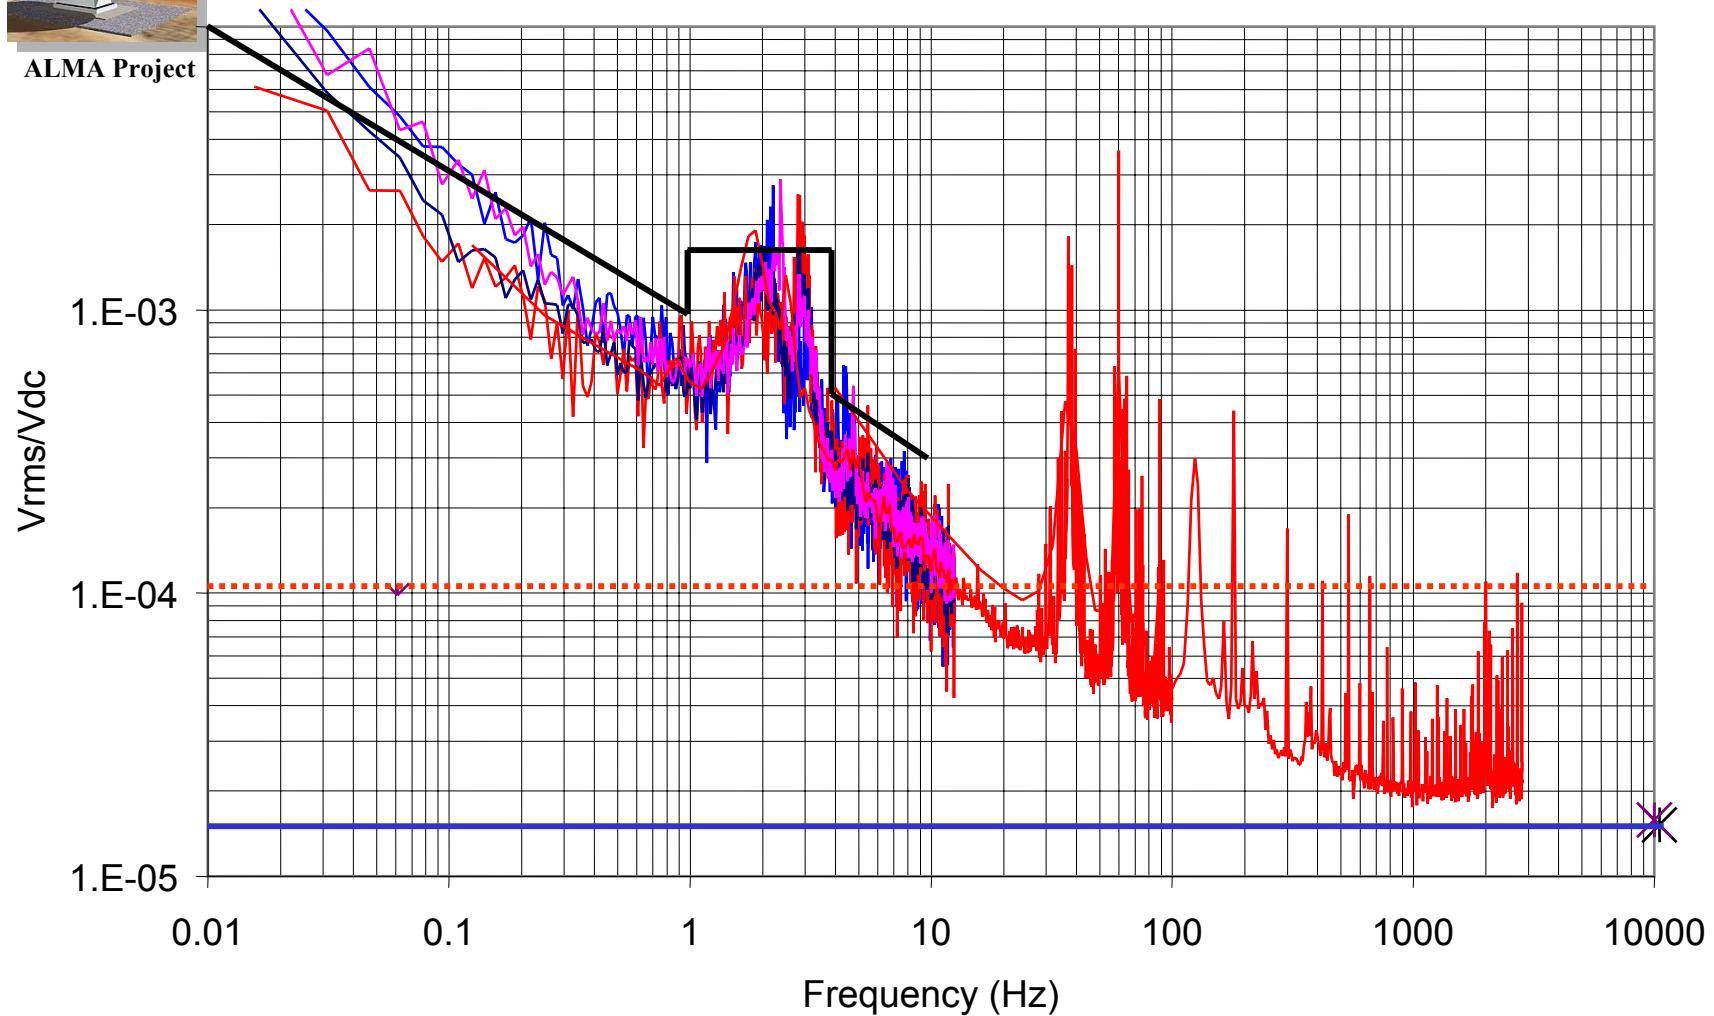

ALMA Project

8 GHz IF BW for no mixer-preamp and analyzer only

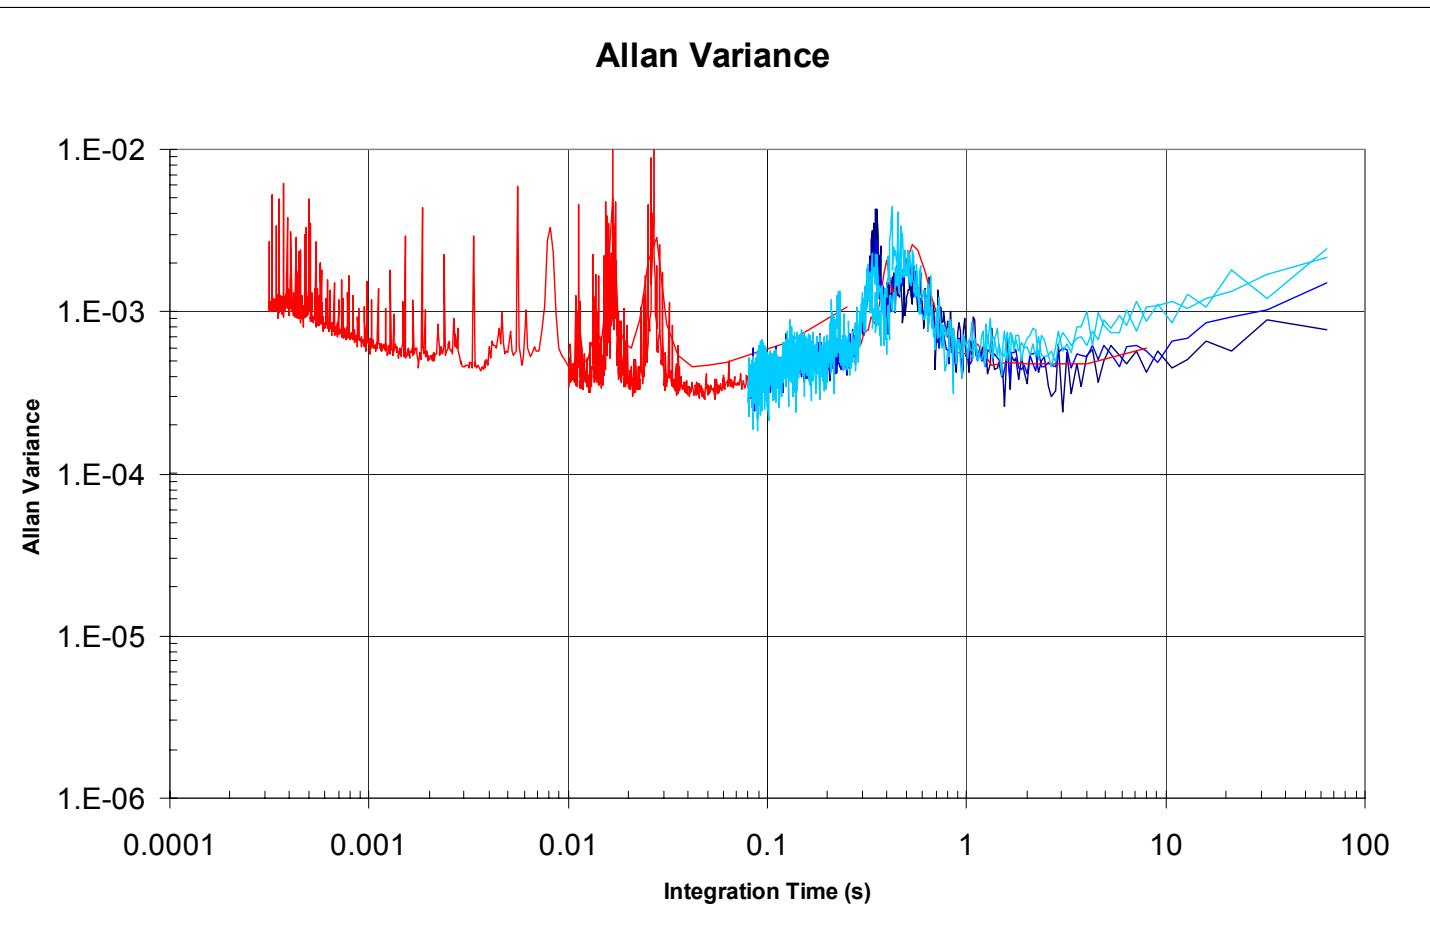

Power spectral density plot  
(Mixer-preamp with 8 GHz IF BW)

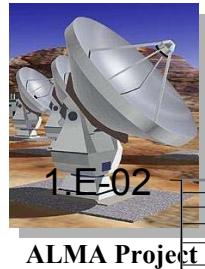

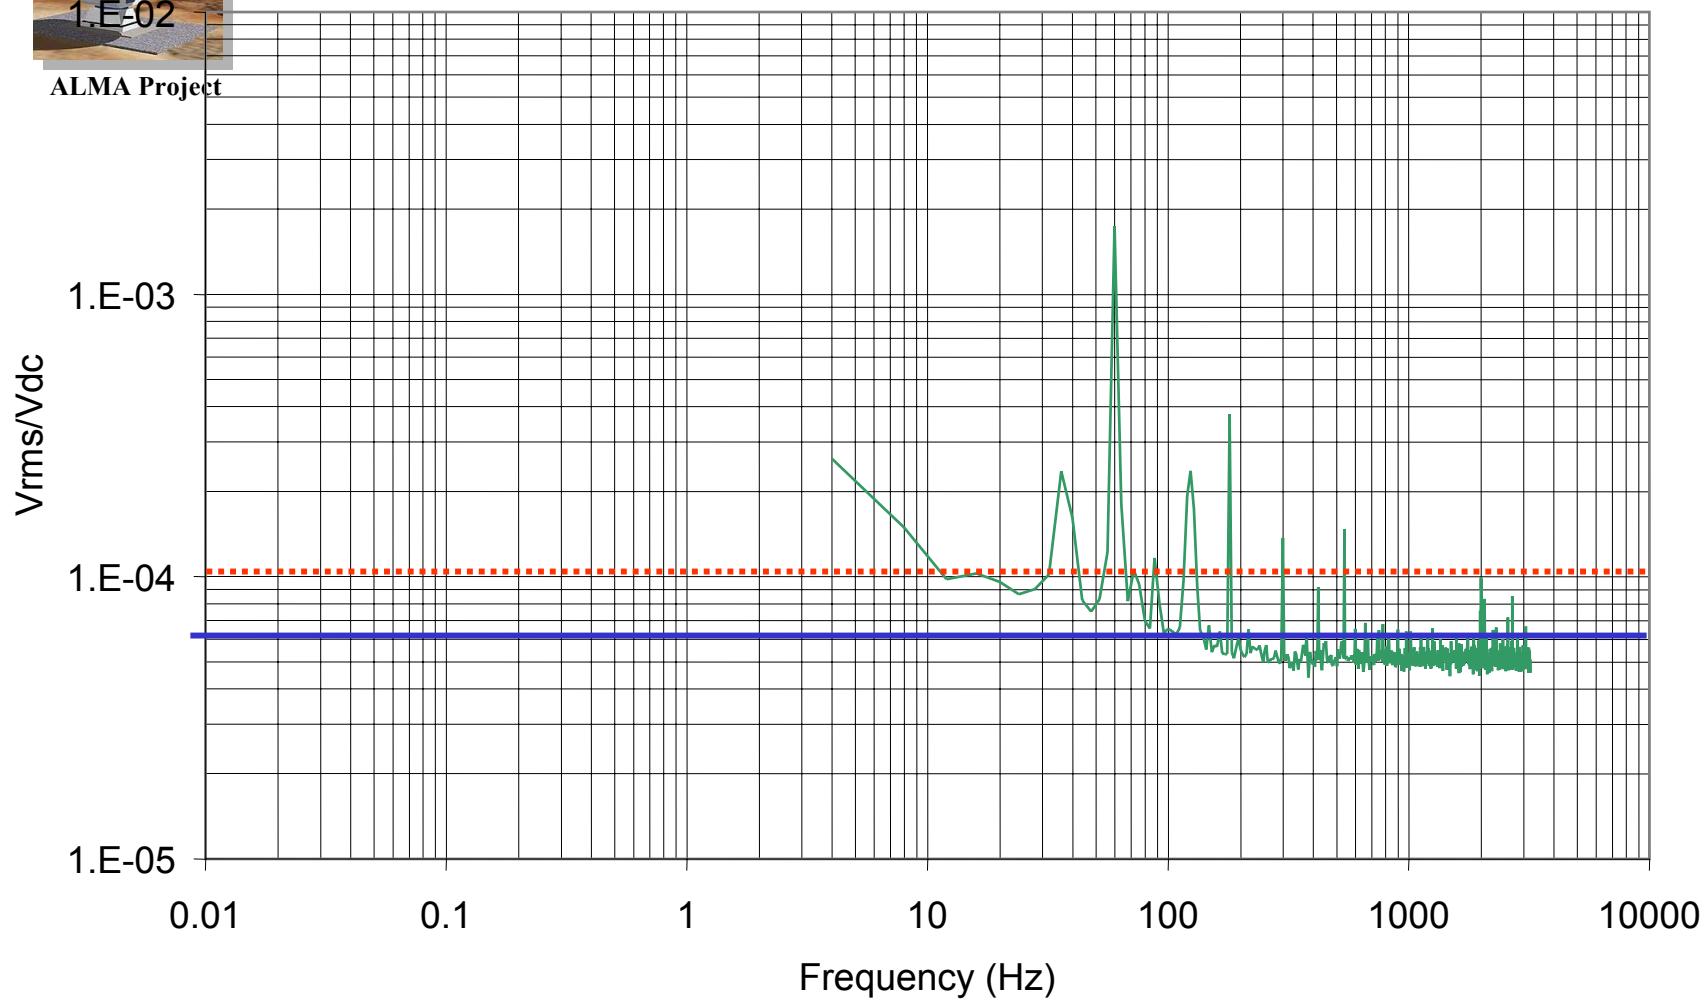

ALMA Project

## Mixer-preamp with 8 GHz IF BW

## Power spectral density plot Mixer-preamp with 500 MHz IF BW

ALMA Project

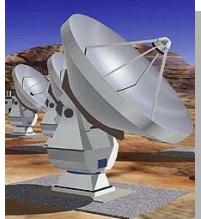

# Improving Front-End gain stability (without compromising performance)

## Cooler temperature fluctuations

- Cryostat meets specs of  $< 2 \text{ mK}$  in one minute
- Passive schemes to damp-out residual temperature fluctuations
- Might consider servoing IF gain to compensate?

## Temperature control of IF chain

Addresses relatively slow variations - front-End design includes active temperature control of all IF components

ALMA Project

# Contracts

- To meet the level one early science milestone we need to finalize contracts immediately
- There is little or no time/budget for further development work
- To successfully place a contract the technical specifications and requirements must be achievable in production quantities
