What can we learn from medical imaging techniques ?

- Urvashi Rau - NRAO [Wednesday Lunch Talk - Socorro - 18 September 2024]

MRI and RI have a very similar indirect-imaging problem.

- NRAO : Cells-to-Galaxies initiative
  - Started by ARDG (S.Bhatnagar) and Technology-transfer office (J.Pixton) in 2019
  - Hosted : Online Lecture Series + In-person Workshop
  - Participated : i2i workshop + ISMRM 2024.

This talk….

- Data acquisition – MR Physics + Measurements
- Image Reconstruction Algorithms – Classical and AI-based
- Relation to the state of the art in Radio Interferometry algorithms.

Measurement Equations have the same structure

coil sensitivity

magnetization

k-space trajectory

magnetic field perturbation

$$m_{c,t} = \int s_c(\vec{r})\, \rho(\vec{r})\, e^{i\vec{k}(t)\cdot\vec{r}}\, e^{i\Delta\phi(\vec{r},t)}\, d^3r$$

$$V_{b,c,t} = \int M_c(\vec{r}, b, t)\, I^{sky}(\vec{r})\, e^{i\vec{k}_b\cdot\vec{r}}\, e^{i\Delta\phi(\vec{r})}\, d^3r$$

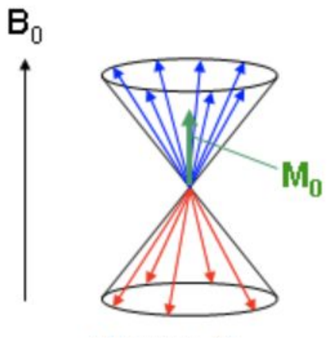
projection effects

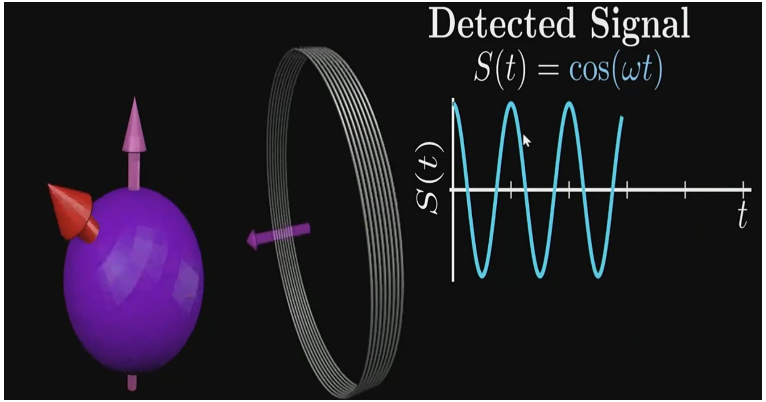
Physics of MRI data acquisition - Signal

B_z ⇒ Constant B field ⇒ Alignment of proton spin axis

RF pulses along the X-Y plane are used to ‘excite’ protons and perturb the M vector

- When RF pulse is turned off, spins continue to precess about Z while they ‘relax’
- NMR signal is detected via Faraday induction (Coils placed around X-Y)





Physics of MRI data acquisition - Spatial Encoding

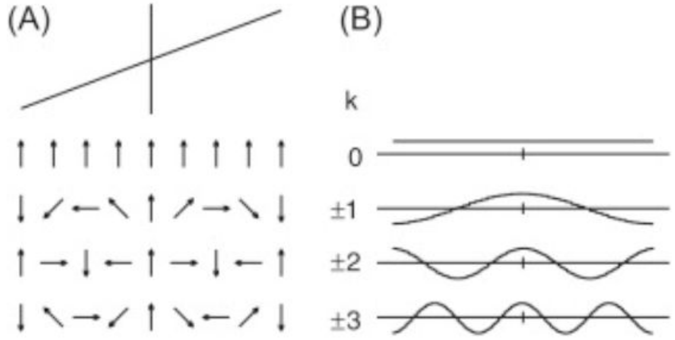
Slice selection :

B_z is a gradient along Z.   Use RF frequency to ‘pick’ a slice to excite.

2D spatial frequency

B_x,y are also gradients

Measured signal amplitude is the “sum” of spatially varying magnetization amplitudes.



Fourier Components + Freedom to choose spatial frequencies to measure.

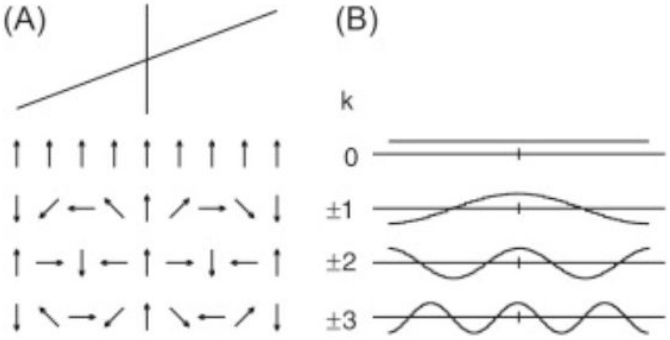
Physics of MRI data acquisition - Spatial Encoding

Slice selection :

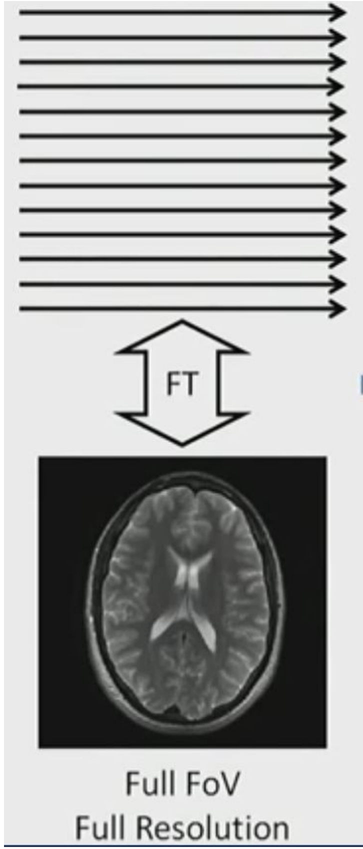
B_z is a gradient along Z. Use RF frequency to ‘pick’ a slice to excite.

2D spatial frequency

B_x,y are also gradients



Measured signal amplitude is the “sum” of spatially varying magnetization amplitudes.



Fourier Components + Freedom to choose spatial frequencies to measure.

Data acquisition constraints

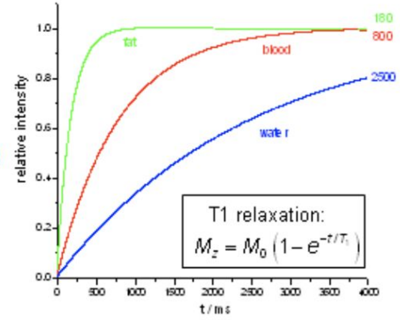
Relaxation Timescales

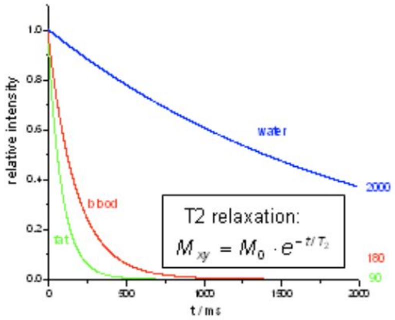
T1 : The flipped magnetization vector moved back to B_z

⇒ Loss of spatial isolation

T2 : Alignment along X-Y becomes incoherent

⇒ decreasing signal amplitude





Need to take measurements in-between these timescales….

Different tissues respond differently ⇒ Contrast Enhancement ⇒ Scheduling problem.

An complex art form

ML/AI R&D here too

An complex art form

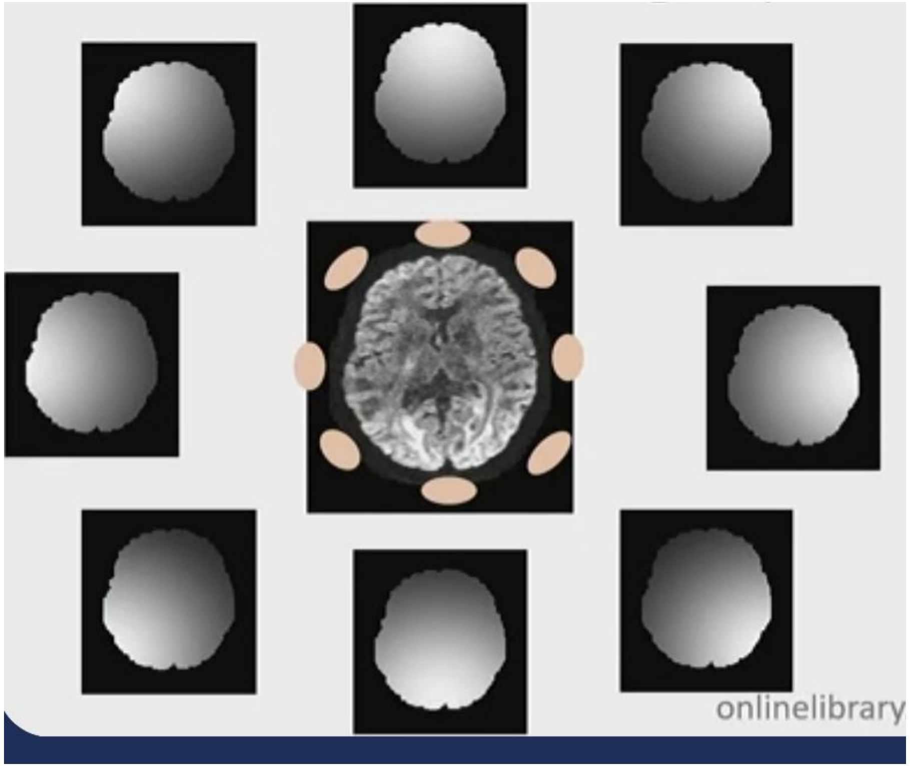
ML/AI R&D here too

Also….. Instrument Noise, Body Noise,

Movement artifacts,

Limits to B-field strength

Parallel Imaging



Simultaneous Data Acquisition using multiple receive coils.

“Coil Sensitivity Patterns”

[[Primary Beams]]

Significant spatial overlap….

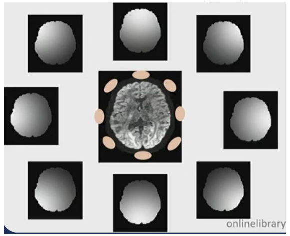
⇒ Improved sensitivity

⇒ Wider field of view.

Joint Imaging : GRAPPA // SENSE

[[A-Projection // Linear Mosaic]]

Parallel Imaging

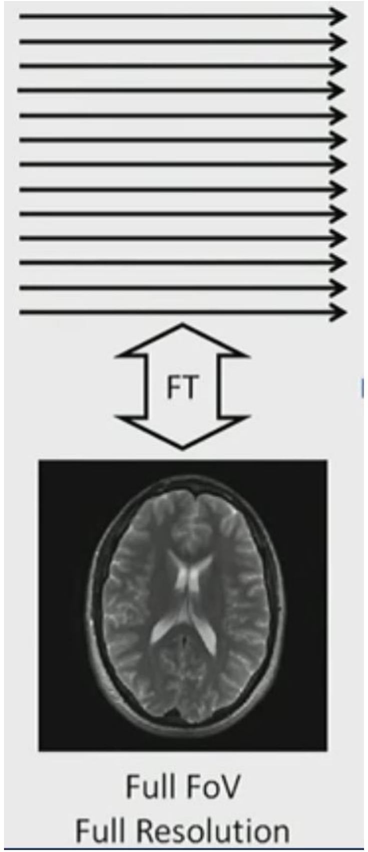


[GRAPPA]

- K-Space Convolution with a kernel = F(C) = 
  measured near K=0

[SENSE]

- Undo linear combination of I x C in the image domain



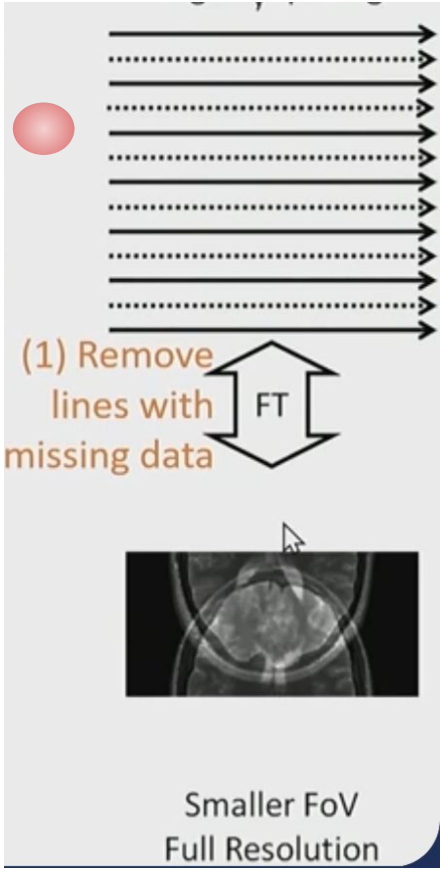


Image Reconstruction

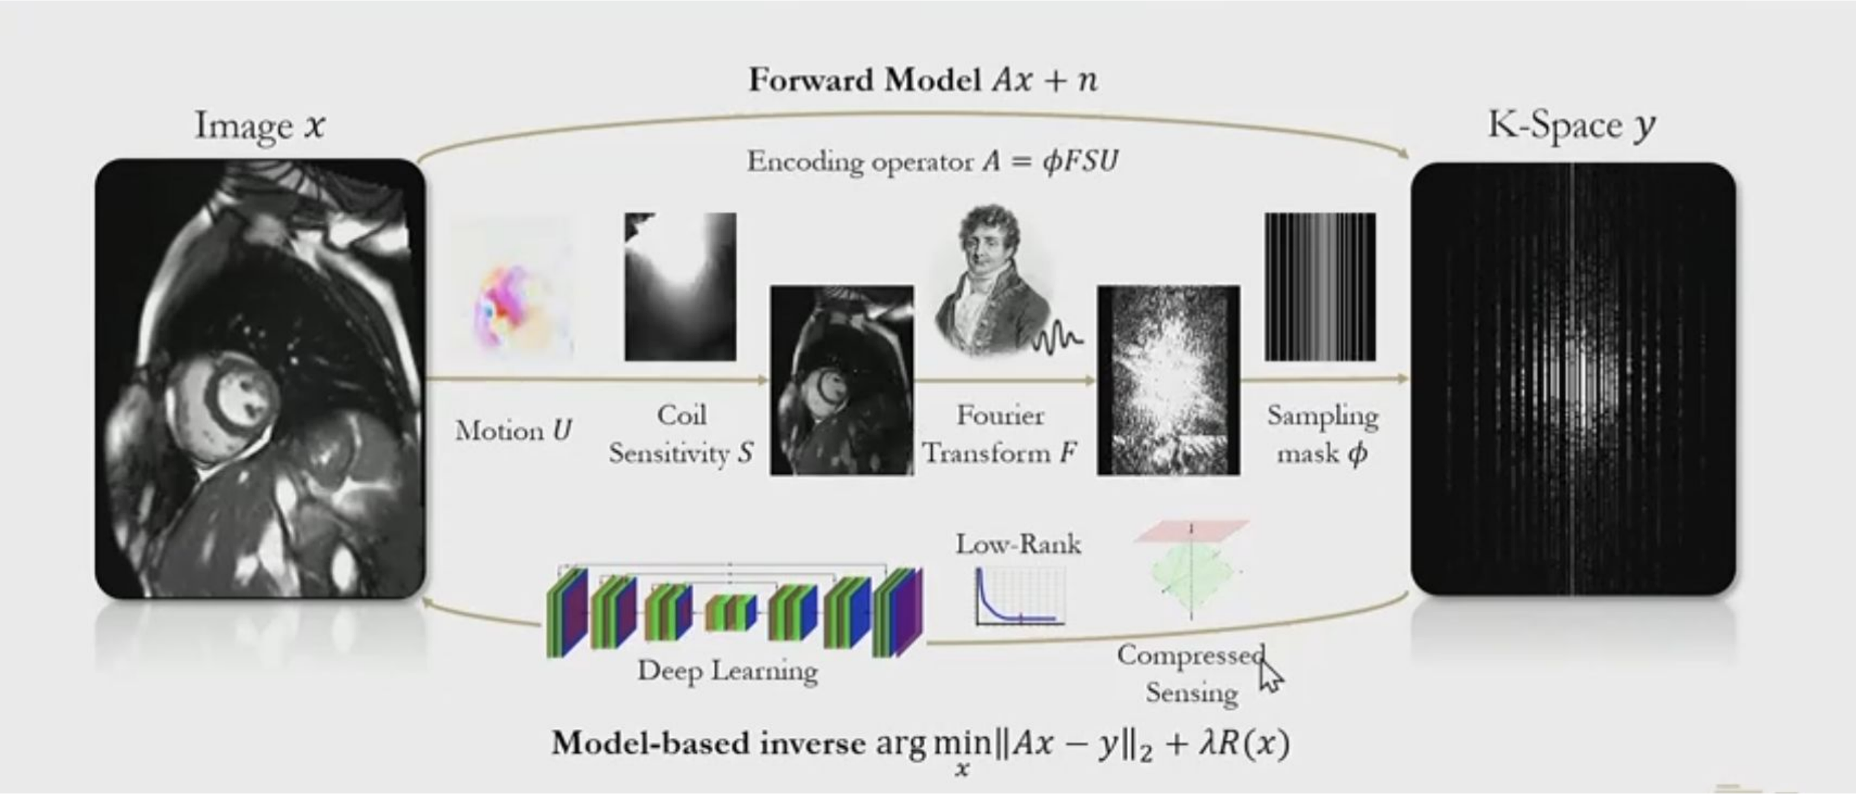
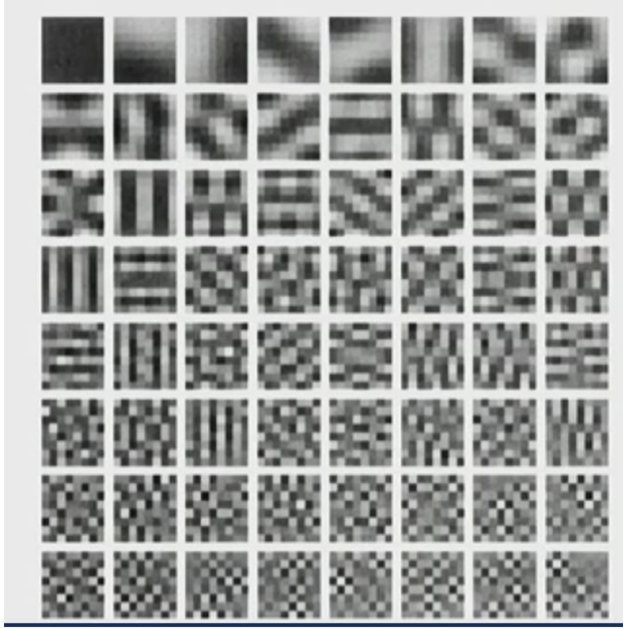


[[Major and minor Cycles + Plug'n'play different 'minor cycle' algorithms]]

Image Reconstruction – Dictionary methods

$$\min_{\mathbf{x}} \frac{1}{2}||\mathbf{y} - \mathbf{A}\mathbf{x}||_2^2 + Q(\mathbf{x})$$



Bayesian view + Priors

– Likelihood term (Chi-Sq) , nu-FFT, Prior terms

– Image = linear combination of patches

– L1 regularization to get sparsity

(i.e. find the min number of unique patches that represent the structure)

[[Sky Model : Points, List of multiscale Paraboloids, Wavelets, etc…]]

Image Reconstruction – Dictionary methods

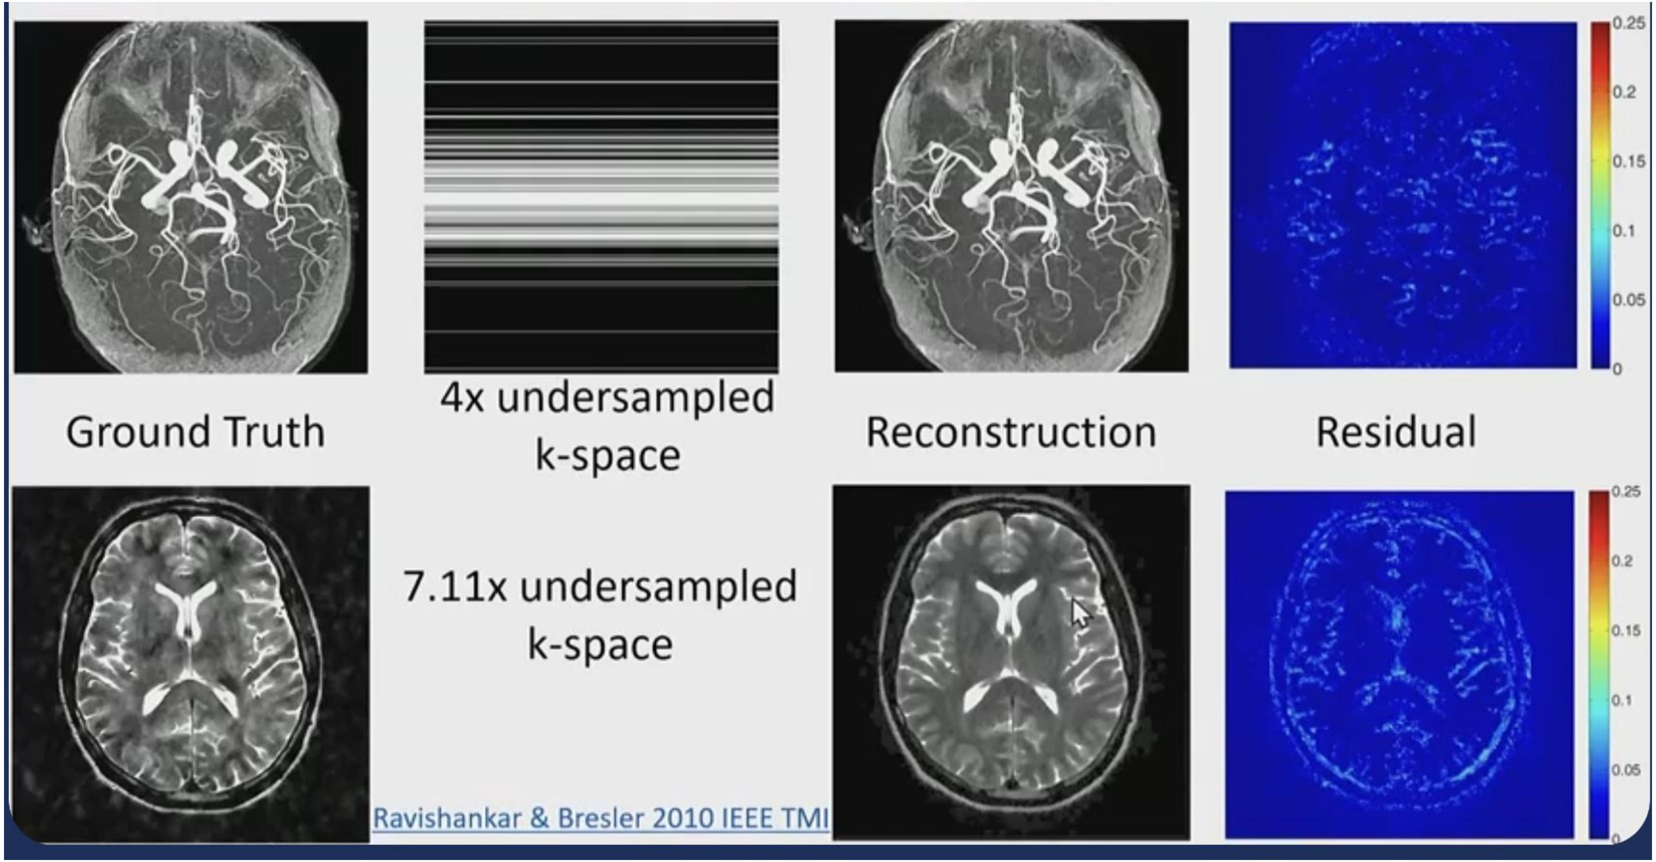


Image Reconstruction - Low Rank Models

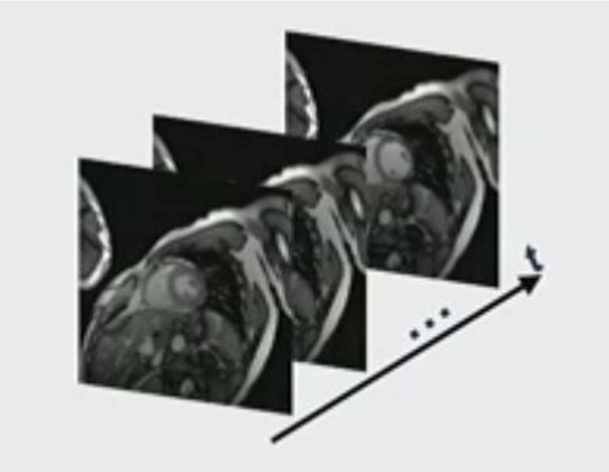
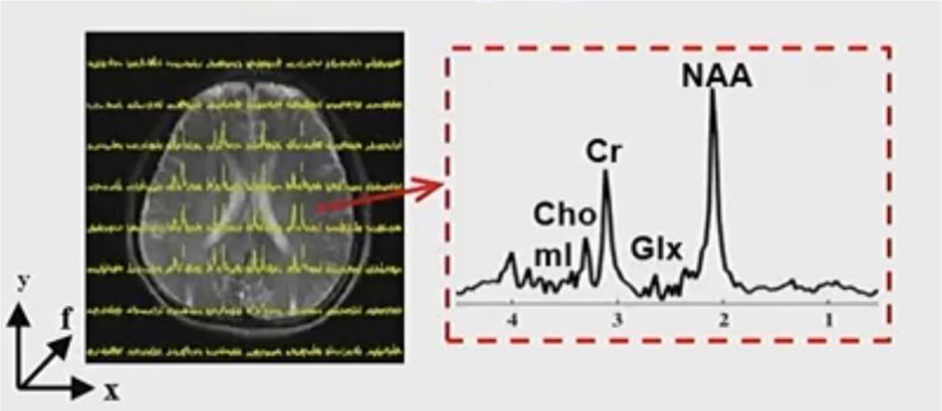
Joint Reconstructions across axes with slow variability

(Linear combination models, with partial separability.)

[[MT-MFS, TV-MT-MFS , etc…]]





SPICE : A joint modeling approach for Spectral Lines

Low-rank on Spatial axes

[[??]]

Image Reconstruction - Machine Learning

Started in 2016…… by 2024, the ISMRM needed a “non-AI methods” session….

Supervised Learning

– Use labeled data : Fully sampled k-space + Truth images

– Learn “ Transforms “

Unsupervised learning

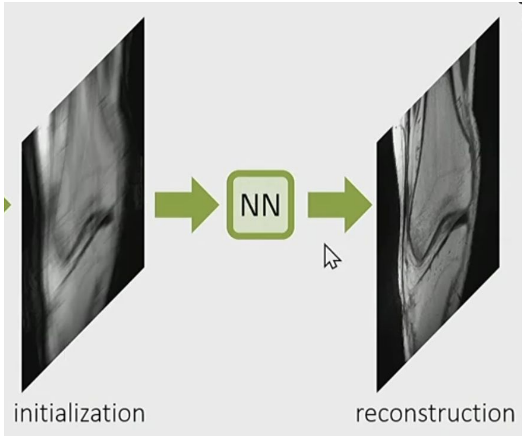
– Discover patterns in unlabeled data

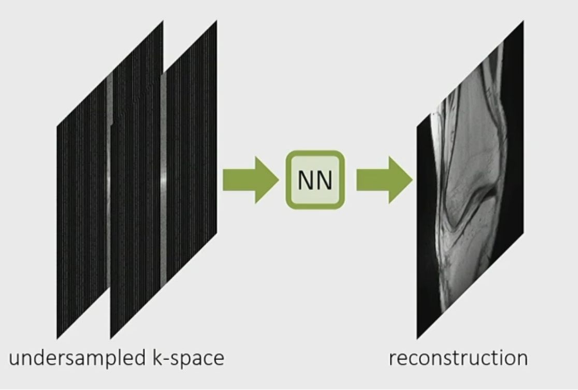
– Learn “ Probabilities of features “ : Generative Modeling…

Image Reconstruction - Supervised Learning

Image Denoising & Super-Resolution

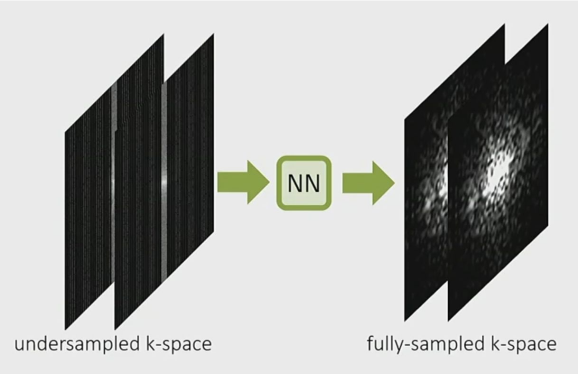
⇒ Learn "dirty to clean" transform for some range of PSF shapes





K-Space to Image

⇒ Learn the FT and some image shapes



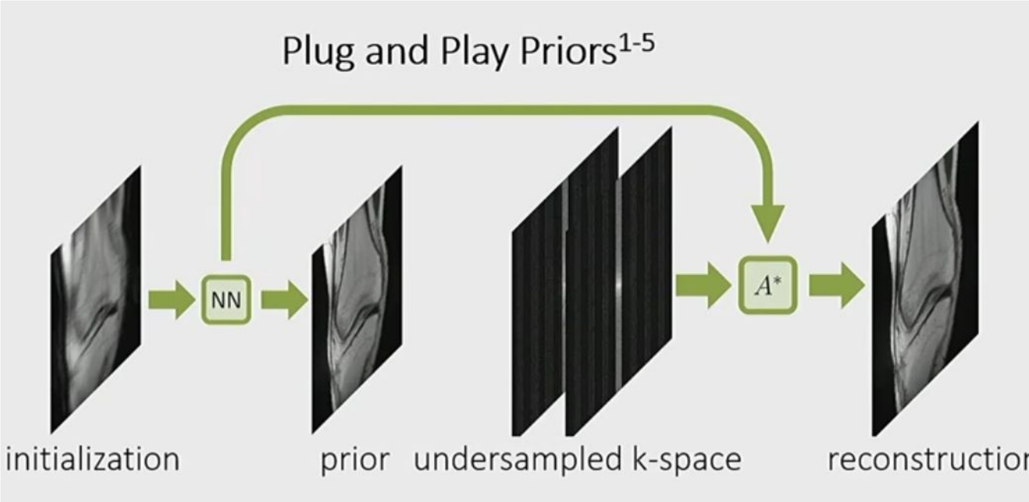
K-Space Interpolation

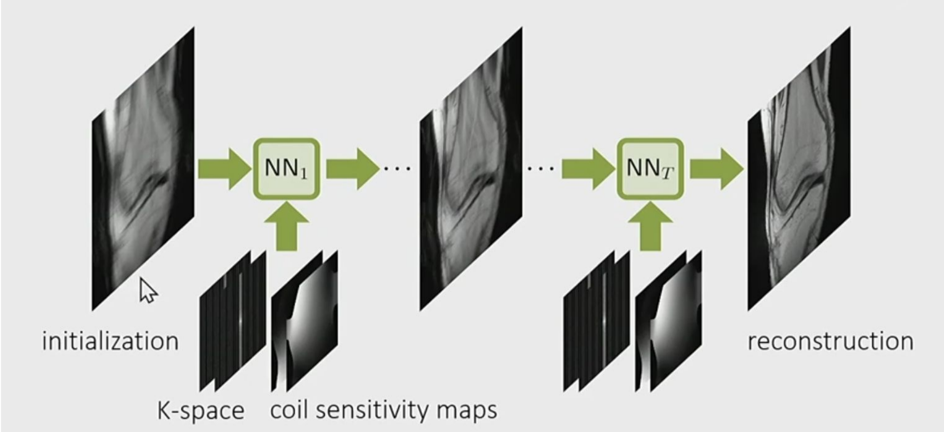
⇒ Learn interpolation rules

Image Reconstruction - Supervised Learning

Plug and Play methods

⇒ Denoising/superresolution as a ‘minor cycle’ algorithm.





Physics-based models

⇒ Use (or solve for and use) instrumental terms as part of imaging

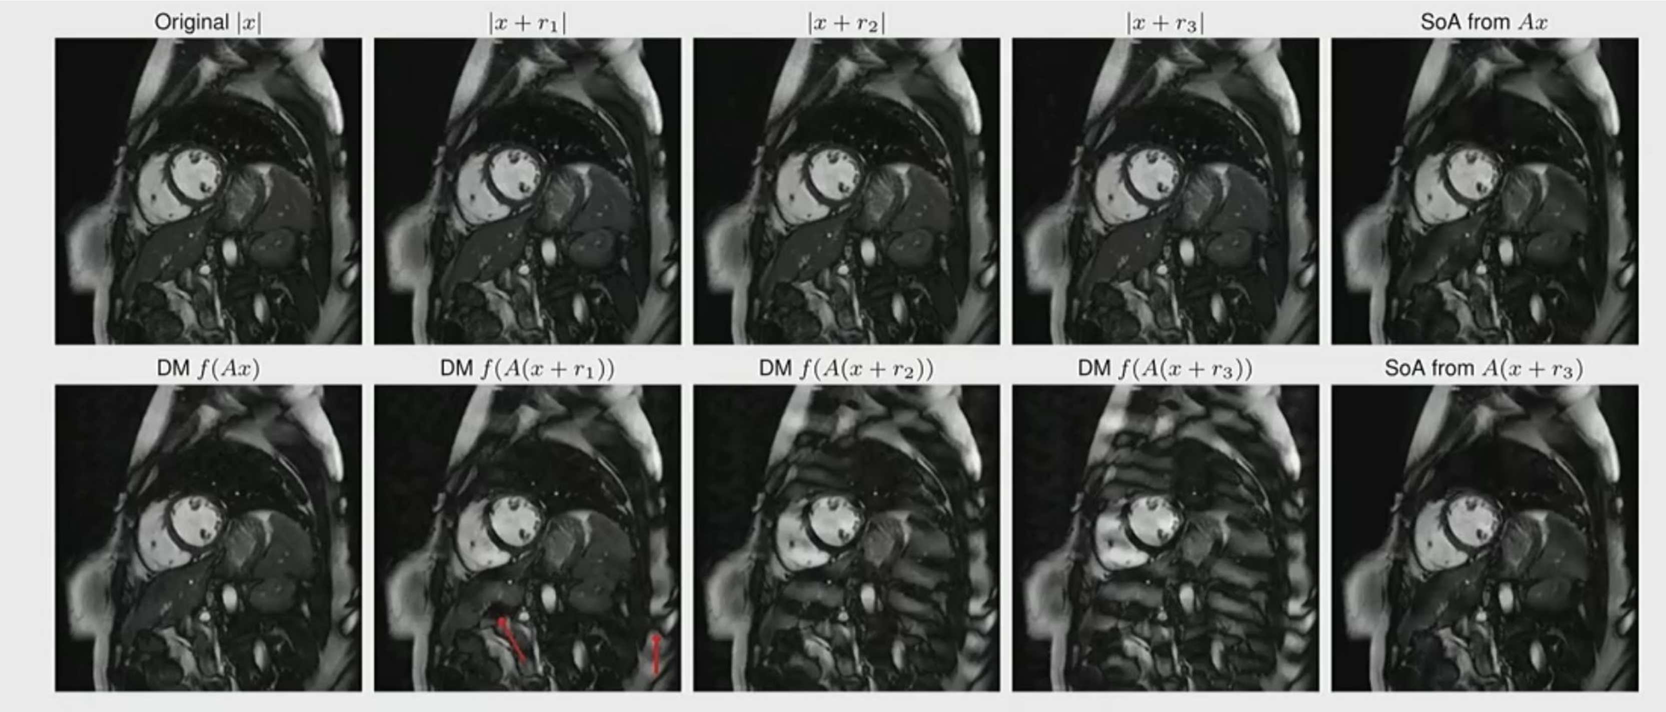
(e.g. pbcor, mosaic, etc..)

ML - Image Reconstruction Errors – Some are easy to hack

Increase data noise —---->

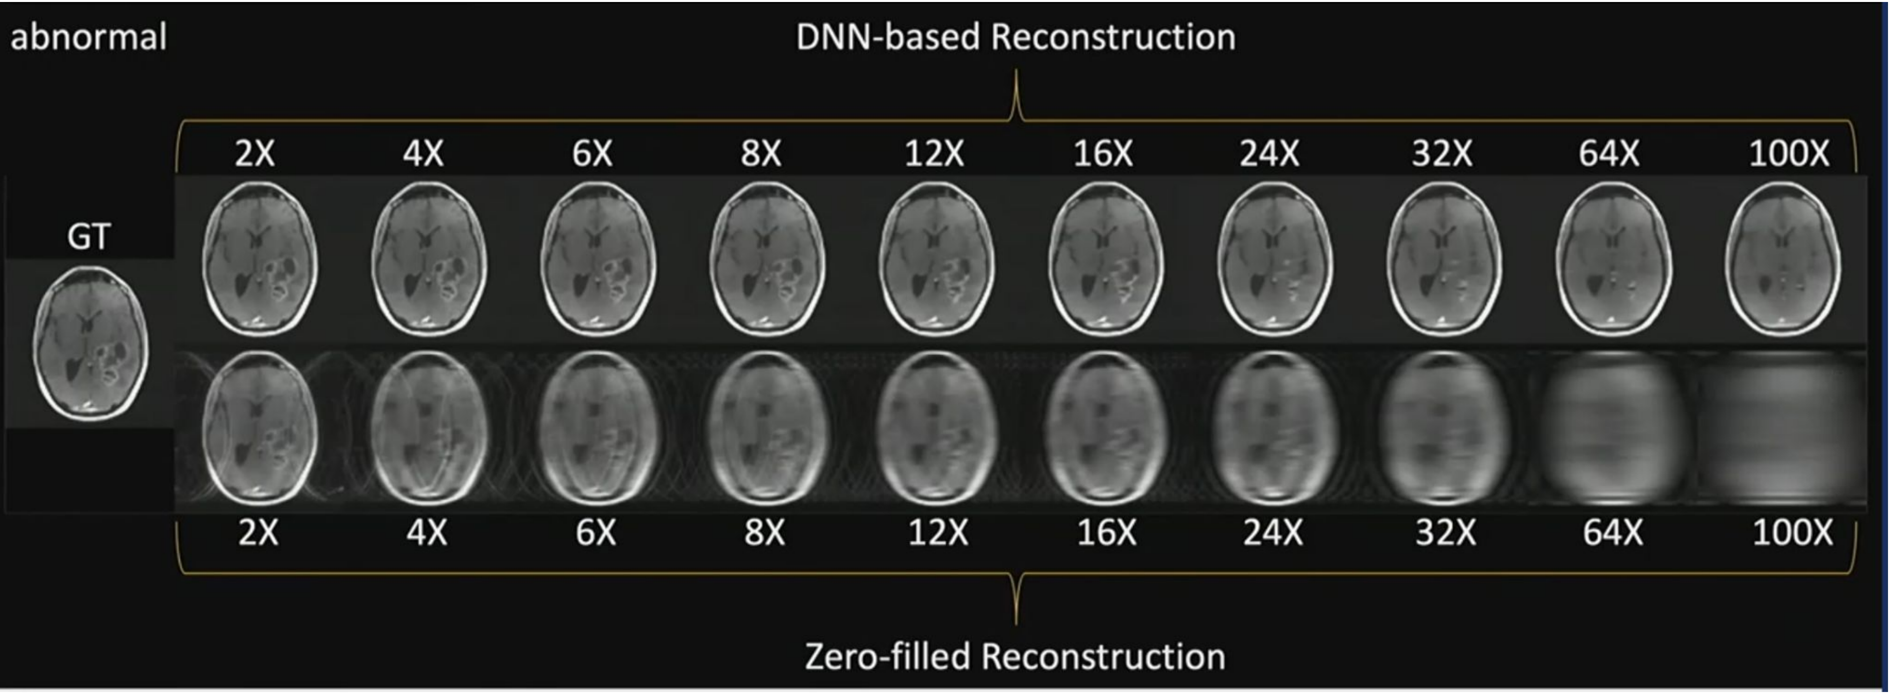
Classical

Deep Learning



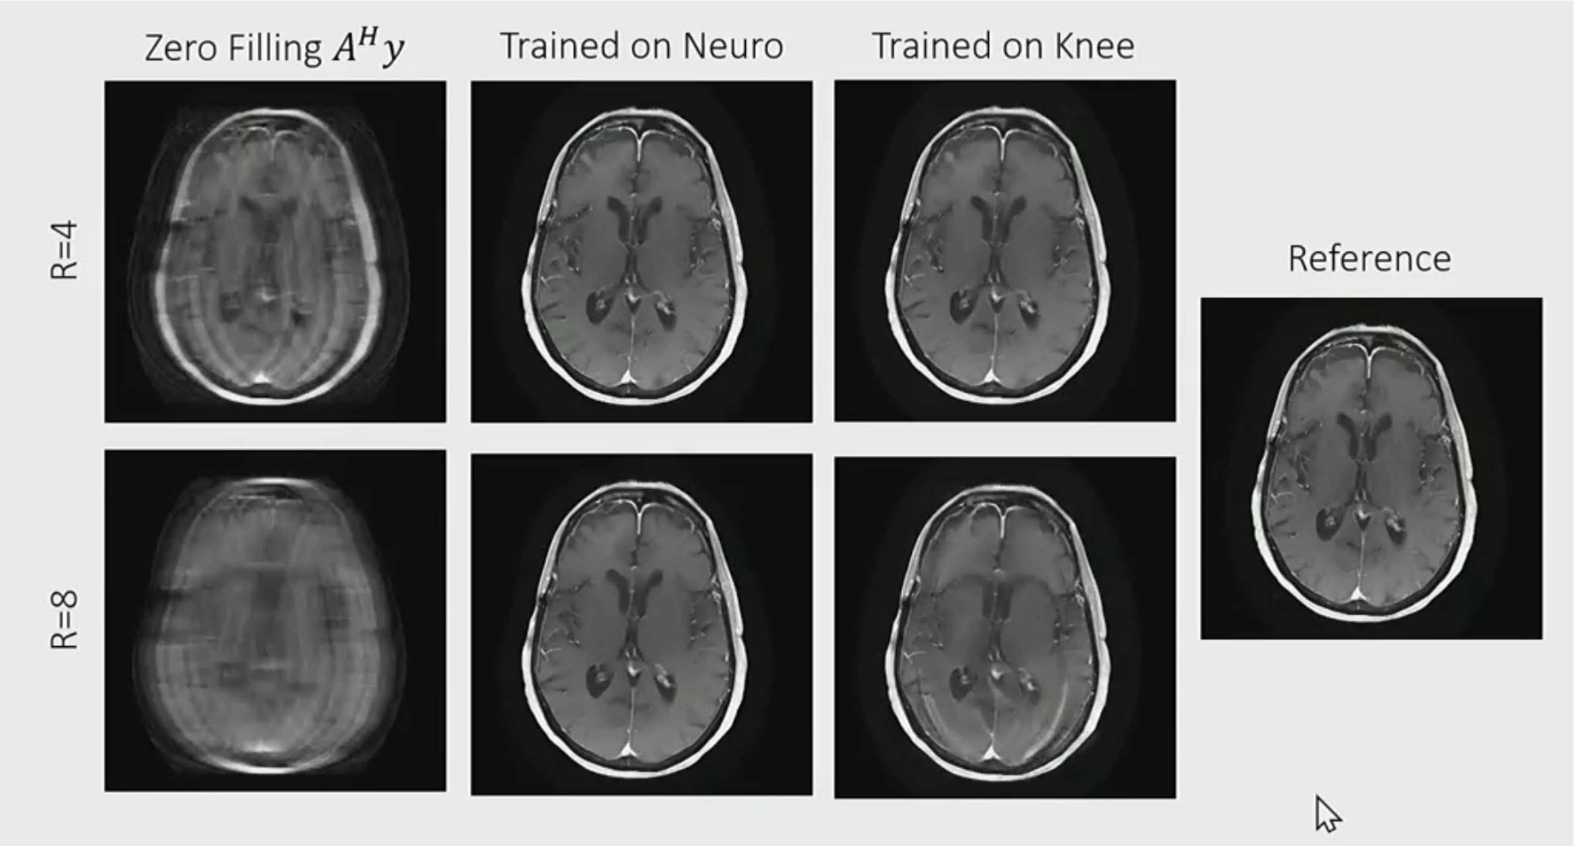
ML - Image Reconstruction Errors – Overconfidence

Sparser K-space sampling —-->



ML - Image Reconstruction Errors – Hallucination

Sparser
K-space



Lessons from 8 years of exploration with ML/AI (video)

Classic Methods,

Plug-n-play / Unrolled,

Generative Modeling

→ Where are they useful ?

→ Where do they tend to fail ?

Speed, Accuracy, Generalizability, Training Cost,

Robustness, Uncertainty estimation —-> Which are easier to take to production?

What is the Radio Interferometry landscape ?

Classical methods

Sky model (points, paraboloids, smooth spectra. L2 min with regularization (CLEAN, MS/MT, ASP, MORESANE). (Bayesian) bias terms and (sparsity-L1) priors (MEM, RESOLVE, MPOL,SARA, PURIFY). Direct modeling and MCMC (e.g. EHT algorithms, SMILI)

Plug'n'play deconv and gridders. Low-rank models and Joint Recons. Solving for DD instrumental terms.

Machine learning exploration - early steps…

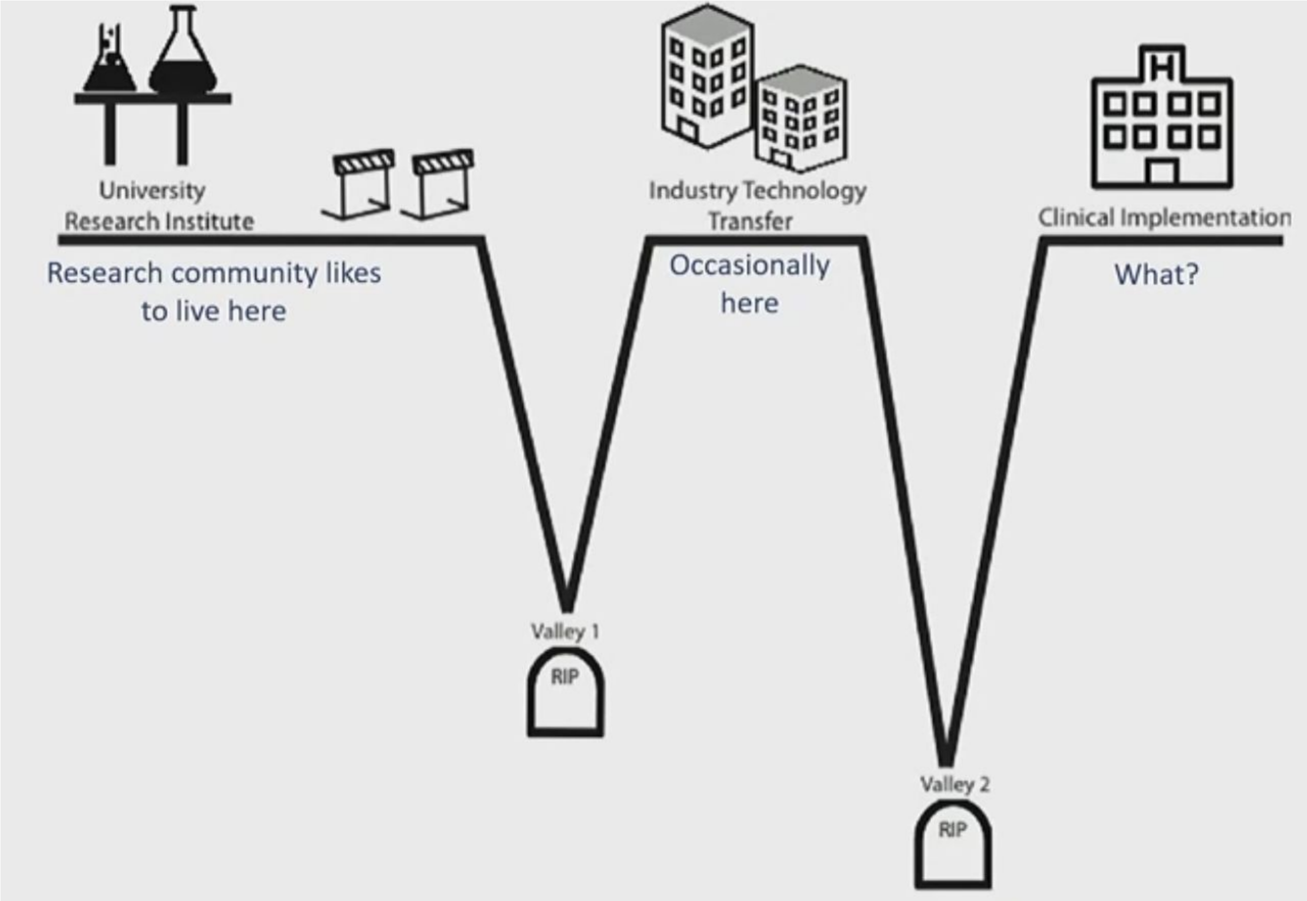
Several attempts at using CNNs/DNNs for image-domain super-resolution and denoising.

POLISH : Applying denoising/superresolution algorithms to deconvolve a range of PSFs (scaling, rotation, shift, random phase distortion (cal errors). Image domain only.

DEEP-FOCUS : Auto-encoder with a 'meta learner' that optimizes across NN architectures for ALMA reconstructions. Image domain only.

AIRI - Use a 'DNN-based denoiser" as a 'minor cycle' of standard image reconstruction. (plug'n'play class of algos with major/minor cycles)

Algorithm R&D —> Production Development —> Clinical Users



Algorithm R&D —> Production Development —> Clinical Users

A very familiar dynamic …

– Very few R&D results actually make it into production.

 – Compressed Sensing and Parallel Imaging (in the past 15yrs)

– Clinical scientists (at companies) choose what goes to production.

 – Constraints : Cost-vs-benefit + Generalizability/Robustness requirements

– Clinical users still have unmet needs.

The ISMRM had talks that tried to address this — “Solve the right problems”

⇒ Better connect R&D efforts + Production Metrics + User Needs

⇒ Algorithms need to be robust
